

Swedish Lidar Metrics

Peder Axensten, Jörgen Wallerman, and Rubén Valbuena

February 19, 2024

Introduction

To produce the Swedish forest variables (published via the Swedish Forest Agency) we use models with specific metrics as independent data and data from the Swedish NFI as dependent data. Thus, we calculate metrics in raster form as well as for the NFI plots. As such metrics may be useful also in other situations, we make a set of metrics available through “Skogsdataalabbet” (where .to.download).

This document contains information on the available metrics.

WHAT THE METRICS MAY BE USED FOR

The metrics are published as open data under the Simplified BSD License¹ and may be used for any non-criminal purpose as long as the following is clearly stated: “Data is produced by the Swedish University of Agriculture (SLU), for more information see www.slu.se.”

WHAT THE METRICS CAN BE USED FOR

We use a subset of the metrics to produce the Swedish forest variables published through the Swedish Forest Agency.²

FILES

To define a metric you combine a statistic and a filter, the naming convention is `year_statistic_filter` as detailed in “??”, “??”, and “??”, below.

Rasters

All the available metrics are saved as geotiff raster files (suffix `.tiff`) using lossless compression and the SWEREF99 TM projected georeference system. The resolution is $10 \times 10 \text{ m}^2$.

Text file

Along with the raster files, there is a text file `year_plots.csv` containing the metrics as well as forest variables from the Swedish NFI permanent plots. The text file uses semicolon as column separator. The plot coordinates are not included as they are not published by the Swedish NFI.

Metrics

Available statistics

- The number of points: count. You probably do not want to use count directly, but rather divide two counts with different filtering to get a proportion.
- Summary statistics: mean, mean2, variance, skewness, and kurtosis.
- Percentiles: p10, p20, p30, p40, p50, p60, p70, p80, p90, and p95.
- L-moments: L2 (L-scale), L3 (L-skewness), and L4 (L-kurtosis).
- Median absolute deviation: mad.

Filtering

You choose if you want all points (all) or only the first returns (1ret). Optionally you also choose a boundary (_geHcm).

- all (all points) or all_geHcm (all points greater than or equal to H cm).
- 1ret (all first returns) or 1ret_geHcm (all first returns greater than or equal to H cm).

All the statistics come with at least the following filters (count has a few extra):
_1ret, _1ret_ge150cm, _all, and _all_ge150cm.

Examples

- 2022_variance_all (sample variance of all points),
- 2022_variance_1ret (sample variance of first returns), and
- 2022_count_1ret_ge150cm (number of first returns greater than or equal to 1.5 m).

DEFINITIONS

- n , the number of values.
- z_i , value i , where $1 \leq i \leq n$.
- $z_{(i)}$, ordered value i , where $1 \leq i \leq n$ and $z_{(i)} \leq z_{(i+1)}$.
- \bar{z} , the mean.

Number of points

TAG: count

DESCRIPTION: The number of z -values.

Mean value

TAG: mean and mean2

DESCRIPTION: The mean and the mean of the squares, respectively.

$$\frac{1}{n} \sum_{i=1}^n z_i \quad \text{and} \quad \frac{1}{n} \sum_{i=1}^n z_i^2$$

Standard deviation

TAG: –

DESCRIPTION: The standard deviation is the same as the square root of the variance and is not included – use $\sqrt{\text{variance}}$ instead.

Variance

TAG: variance

DESCRIPTION: The sample variance.

$$\frac{1}{n-1} \sum_{i=1}^n (z_i - \bar{z})^2$$

Skewness

TAG: skewness

DESCRIPTION: The sample (G_1) skewness.

$$\frac{\sqrt{n(n-1)}}{n-2} \cdot \sqrt{n} \cdot \frac{\sum_{i=1}^n (z_i - \bar{z})^3}{[\sum_{i=1}^n (z_i - \bar{z})^2]^{1.5}}$$

Kurtosis

TAG: kurtosis

DESCRIPTION: The sample kurtosis.

$$\frac{(n+1)(n-1)}{(n-2)(n-3)} \cdot n \cdot \frac{\sum_{i=1}^n (z_i - \bar{z})^4}{[\sum_{i=1}^n (z_i - \bar{z})^2]^2} - \frac{3n^2}{(n-2)(n-3)}$$

Percentile k

TAG: pk

DESCRIPTION: The value $z_{(p)}$ for which k % of all values are smaller: $p = \frac{k}{100} \cdot n$.
When p is not an integer value, $z_{(p)}$ is the linear interpolation of the two adjacent values.

Median absolute deviation

TAG: mad

DESCRIPTION: Median absolute deviation: $\text{median}(|z_i - \bar{z}|)$

L-mean

TAG: –

DESCRIPTION: The mean has the same value in ordered statistics as in unordered, so L1 is not included – use mean instead.

L-scale

TAG: L2

$$\frac{1}{2} \binom{n}{2}^{-1} \sum_{i=1}^n \left[\binom{i-1}{1} - \binom{n-i}{1} \right] \cdot z_{(i)}$$

L-skewness

TAG: L3

$$\frac{1}{3} \binom{n}{3}^{-1} \sum_{i=1}^n \left[\binom{i-1}{2} - 2 \binom{i-1}{1} \binom{n-i}{1} + \binom{n-i}{2} \right] \cdot z_{(i)}$$

L-kurtosis

TAG: L4

$$\frac{1}{4} \binom{n}{4}^{-1} \sum_{i=1}^n \left[\binom{i-1}{3} - 3 \binom{i-1}{2} \binom{n-i}{1} + 3 \binom{i-1}{1} \binom{n-i}{2} - \binom{n-i}{3} \right] \cdot z_{(i)}$$

List of all the metrics

count_1ret	count_1ret_ge150cm	count_all	count_all_ge150cm
kurtosis_1ret	kurtosis_1ret_ge150cm	kurtosis_all	kurtosis_all_ge150cm
L1_1ret	L1_1ret_ge150cm	L1_all	L1_all_ge150cm
L2_1ret	L2_1ret_ge150cm	L2_all	L2_all_ge150cm
L3_1ret	L3_1ret_ge150cm	L3_all	L3_all_ge150cm
L4_1ret	L4_1ret_ge150cm	L4_all	L4_all_ge150cm
mad_1ret	mad_1ret_ge150cm	mad_all	mad_all_ge150cm
